

PRACTICAL AI IMPLEMENTATION MANUAL

AI Leadership in Action

Telekom Networks Malawi Executive Programme

Practical AI Implementation Manual

Step-by-step prototypes using ChatGPT and Microsoft Copilot

Telekom Networks Malawi Executive Programme | UCT Graduate School of Business

Prepared for AI Leadership in Action

Facilitator: Prof. Abejide Ade-Ibijola

This manual uses fictional or approved training data. Do not upload customer PINs, passwords, identity documents, live Mpamba transactions, confidential employee records, privileged legal material, or unapproved Board information.

How to Use This Manual

Purpose. Each section shows how TNM participants can create a practical prototype with ChatGPT and Microsoft Copilot. The emphasis is on learning, testing and responsible design—not unsupervised production deployment.

Full workshop prototype	The complete file-based demonstration can be built during the practical session. Production still needs security, integration and governance.
Partial proof of concept	ChatGPT/Copilot can analyse synthetic data and show the logic, but cannot provide the live telemetry, secure transaction processing, real-time model deployment or operational control required for production.
ChatGPT route	Use a regular chat or Project for a quick prototype; use a custom GPT where available for a reusable, instructed assistant.
Microsoft route	Use Microsoft 365 Copilot Chat for file-based work; Agent Builder for a reusable grounded agent; Copilot Studio for approved workflows, connectors and deployment.
Availability	Menus and capabilities depend on licence, organisational settings and administrator permissions. If an option is absent, use the simpler file-and-prompt route.

Common Safety Rules

- Use synthetic, public, redacted or explicitly approved training data.
- Remove names, phone numbers, IDs, PINs, passwords and unnecessary personal information.
- Require the AI to state when information is missing and to cite the source used.
- Keep human approval for financial, legal, employment, network-control and Board decisions.
- Test accuracy, false positives, bias, language quality and unsafe behaviour before sharing.
- Record prompts, files, model/version, test results, corrections and final human decision.

Contents and Practical Status

No.	Practical AI Use	Workshop Status
1	Multilingual Customer-Service Copilot	FULL WORKSHOP PROTOTYPE

12	Enterprise Risk-Sensing AI	PARTIAL PROOF OF CONCEPT

Multilingual Customer-Service Copilot

Business area: Customer Experience

FULL WORKSHOP PROTOTYPE

Pain point	Call-centre overload, inconsistent answers, repeated searches, and the need for clear English and Chichewa support.
Prototype outcome	A grounded internal assistant that classifies enquiries, retrieves approved information, drafts a response, and recommends escalation.
Workflow sketch	Customer message -> issue category -> approved TNM knowledge -> draft response -> agent review -> escalation or closure.

Before You Begin

Prepare these inputs

- Bundle and service guides
- FAQs and escalation matrix
- Approved English/Chichewa examples
- Fictional customer enquiries

Workshop rule

- Use fictional, public, redacted or approved data only.
- Name a human reviewer before testing.
- Agree the expected output and pass criteria.

A. Build the Prototype with ChatGPT

- 1 Create a safe knowledge pack:** Remove real customer names, numbers, PINs and transaction details. Use approved guides and fictional cases.
- 2 Start a ChatGPT Project:** Create a Project named "TNM Customer-Service Copilot", upload the files, and add the role instructions.
- 3 Set strict boundaries:** Tell ChatGPT to use only uploaded sources, cite the source, never invent prices or restoration times, and escalate sensitive cases.
- 4 Test routine questions:** Try bundle activation, slow data, SIM registration and account-balance enquiries.
- 5 Test language support:** Ask for a Chichewa response and have a fluent participant review meaning, tone and terminology.
- 6 Score the answers:** Record accuracy, source grounding, escalation quality, language quality and unsafe requests.

Copy-and-Paste Prompt

You are an internal TNM customer-service copilot. Use only the uploaded reference files. Return: Issue category; Suggested response; Recommended action; Escalation required (Yes/No); Source used. Never request a PIN or password, and never invent prices, policies or restoration times.

B. Build the Prototype with Microsoft Copilot

- 1 Store approved files:** Place the demonstration pack in a controlled SharePoint or OneDrive location.
- 2 Use Copilot Chat:** Attach or reference the files and ask for the same structured response.
- 3 Create a reusable agent:** Where available, select New agent in Microsoft 365 Copilot, add instructions and knowledge sources.
- 4 Add starter questions:** Examples: classify a complaint, draft in Chichewa, find the correct escalation route.

5 Pilot with a small team: Require agents to review every answer and flag unsupported responses.

6 Move to Copilot Studio only when needed: Use Copilot Studio for controlled workflows, connectors, Teams deployment and deeper integration.

Test, Limits and Deliverable

Minimum validation	Expected deliverable
• Correct category • Answer supported by a source • Clear English/Chichewa • Sensitive cases escalated • No unnecessary personal data	• A working internal copilot, reusable instruction prompt, knowledge pack, test table and escalation rules.

Important limitation: This is a complete workshop prototype, not an unsupervised production chatbot. Live deployment requires identity controls, approved system access, audit logs, quality monitoring and named service owners.

Complaint Classification and Routing AI

Business area: Customer Operations

FULL WORKSHOP PROTOTYPE

Pain point	Complaints may be misclassified, routed to the wrong team, or escalated too late.
Prototype outcome	A classifier that assigns issue category, urgency, sentiment, responsible team and a short case summary.
Workflow sketch	Complaint text -> category + priority -> responsible team -> summary -> human confirmation -> ticket routing.

Before You Begin

Prepare these inputs

- Complaint-category list
- Priority rules
- Team ownership matrix
- 20-50 fictional complaint examples

Workshop rule

- Use fictional, public, redacted or approved data only.
- Name a human reviewer before testing.
- Agree the expected output and pass criteria.

A. Build the Prototype with ChatGPT

- 1 Prepare examples:** Create a spreadsheet with Complaint Text, Correct Category, Priority and Team.
- 2 Upload the file:** Ask ChatGPT to inspect the categories and identify ambiguous cases.
- 3 Define the output format:** Require a table with Category, Priority, Team, Reason and Confidence.
- 4 Classify a new batch:** Paste or upload fictional enquiries and request classifications.
- 5 Review low-confidence cases:** Ask ChatGPT to mark uncertain or multi-issue complaints for human triage.
- 6 Export the results:** Download the classified table and compare it with the expected answers.

Copy-and-Paste Prompt

Classify each fictional TNM complaint using only the supplied category and routing guide. Return: Category, Priority (Low/Medium/High/Critical), Responsible Team, One-sentence Summary, Reason, Confidence (0-100). Mark ambiguous cases "Human Triage Required".

B. Build the Prototype with Microsoft Copilot

- 1 Open the Excel complaint file:** Use Copilot in Excel or Copilot Chat with the workbook attached.
- 2 Describe the classification rules:** Ask Copilot to apply the approved category and priority definitions.
- 3 Create a result table:** Add Category, Priority, Owner and Reason columns.
- 4 Build an agent if recurring:** Use Agent Builder with the complaint guide as knowledge.
- 5 Test routing prompts:** Check that fraud, legal threats and unresolved Mpamba cases go to specialist teams.
- 6 Share only after review:** Pilot with a small customer-operations group and measure agreement with human triage.

Test, Limits and Deliverable

Minimum validation • Agreement with human label • Correct critical escalation • Consistent routing • Low-confidence flag • No invented case outcome	Expected deliverable • A classified complaint file, routing prompt, confusion log and pilot accuracy score.
--	--

Important limitation: ChatGPT and Copilot can complete the workshop classification task. Production routing needs integration with the ticketing platform, permissions, service-level rules and monitoring of misroutes.

Network Congestion Forecasting AI

Business area: Telecommunications

PARTIAL PROOF OF CONCEPT

Pain point	Traffic surges and congestion are often seen after customer experience has already deteriorated.
Prototype outcome	A demonstration that analyses historical traffic, identifies peak patterns and produces a simple forecast and capacity recommendation.
Workflow sketch	Cell traffic history + events -> clean data -> pattern analysis -> forecast -> risk dashboard -> engineer review.

Before You Begin

Prepare these inputs

- Synthetic cell traffic by hour
- Cell capacity
- Dropped-session data
- Event/calendar information
- Location labels

Workshop rule

- Use fictional, public, redacted or approved data only.
- Name a human reviewer before testing.
- Agree the expected output and pass criteria.

A. Build the Prototype with ChatGPT

- 1 Upload the synthetic network file:** Use clear columns: Timestamp, Cell ID, Traffic, Capacity, Throughput and Dropped Sessions.
- 2 Ask for data-quality checks:** Find missing hours, duplicates and impossible values before forecasting.
- 3 Calculate utilisation:** Request Utilisation = Traffic/Capacity and identify recurring peak windows.
- 4 Create a basic forecast:** Ask for the next-day or event-period forecast with assumptions and uncertainty.
- 5 Visualise the result:** Generate a line chart and a table of cells likely to exceed a chosen threshold.
- 6 Draft an engineering note:** Ask for recommended actions, clearly labelled as proposals for engineer review.

Copy-and-Paste Prompt

Analyse this synthetic TNM cell-traffic dataset. Check data quality, calculate utilisation, identify recurring peaks, forecast the next period, and list cells likely to exceed 85% capacity. State assumptions and uncertainty. Do not recommend automatic network changes.

B. Build the Prototype with Microsoft Copilot

- 1 Open the workbook in Excel:** Use Copilot to inspect trends, formulas and outliers.
- 2 Create utilisation columns and charts:** Ask Copilot to add calculated columns and a peak-hour visual.
- 3 Summarise high-risk cells:** Request a table ranked by predicted utilisation.
- 4 Use Copilot Chat for narrative:** Attach the workbook and ask for a short network-planning note.
- 5 Create a recurring prototype agent:** Use Agent Builder only for reading approved reports, not for live network control.

Test, Limits and Deliverable

Minimum validation • Forecast compared with held-out data • Peak cells correctly identified • Uncertainty stated • No automatic configuration changes • Engineer reviews recommendations	Expected deliverable • A congestion-risk table, forecast chart, assumptions log and draft capacity-planning note.
---	--

Important limitation: ChatGPT and Copilot can demonstrate analysis and simple forecasting. They cannot access live radio telemetry, deploy a production forecasting model, guarantee real-time accuracy, or safely reconfigure the network without engineering systems and controls.

Predictive Site-Maintenance AI

Business area: Network Management

PARTIAL PROOF OF CONCEPT

Pain point	Battery, generator, cooling and other site failures are sometimes detected only after service interruption.
Prototype outcome	A demonstration that scores synthetic sites for failure risk using alarm, power and maintenance history.
Workflow sketch	Sensor/alarm history -> anomaly indicators -> failure-risk score -> ranked maintenance list -> engineer inspection.

Before You Begin

Prepare these inputs

- Synthetic battery voltage
- Generator runtime
- Temperature
- Alarm counts
- Maintenance dates
- Known failure outcomes

Workshop rule

- Use fictional, public, redacted or approved data only.
- Name a human reviewer before testing.
- Agree the expected output and pass criteria.

A. Build the Prototype with ChatGPT

- 1 Upload site-history data:** Use one row per site-day or site-hour.
- 2 Ask for anomaly checks:** Identify sudden voltage drops, abnormal temperature and long generator runtime.
- 3 Create transparent risk rules:** Build a simple, explainable score before attempting complex modelling.
- 4 Rank sites:** Request High, Medium and Low risk with reason codes.
- 5 Test against known failures:** Compare the score with a hold-out set of recorded failures.
- 6 Prepare work orders:** Draft inspection recommendations, not automatic equipment-replacement decisions.

Copy-and-Paste Prompt

Using this synthetic TNM site dataset, identify abnormal power and temperature patterns, create an explainable failure-risk score, rank sites, and give reason codes. Do not state that a component has failed unless the data confirms it. All maintenance actions require engineer review.

B. Build the Prototype with Microsoft Copilot

- 1 Use Excel for the risk score:** Create formulas and conditional formatting for risk indicators.
- 2 Ask Copilot to explain anomalies:** Request plain-language reasons for each high-risk site.
- 3 Build a maintenance dashboard:** Show risk, last visit, downtime and estimated urgency.
- 4 Use Copilot Chat for summaries:** Create a regional maintenance brief from the workbook.
- 5 Keep approvals manual:** Engineers confirm diagnosis and parts requirements.
- 6 Record false alarms:** Use pilot results to refine the scoring method.

Test, Limits and Deliverable

Minimum validation	Expected deliverable
• Known failures detected • False alarms measured • Reason code present • Older/rural equipment tested • Engineer confirmation	• A ranked maintenance list, risk dashboard, reason-code guide and pilot evaluation table.

Important limitation: A production solution needs reliable sensors, time-series infrastructure, labelled failure history, field-system integration, continuous monitoring and model retraining. ChatGPT/Copilot provide an analytical prototype only.

Mpamba Fraud-Anomaly Detection AI

Business area: Mobile Money

PARTIAL PROOF OF CONCEPT

Pain point	Fraud may appear as a sequence of small behavioural changes rather than one transaction above a fixed threshold.
Prototype outcome	A safe demonstration using fictional transactions to identify unusual device, location, recipient and velocity patterns.
Workflow sketch	Synthetic transactions -> behavioural features -> anomaly score -> reason codes -> step-up verification/human review.

Before You Begin

Prepare these inputs

- Fully synthetic transaction file
- Device-change flag
- SIM-swap flag
- Recipient history
- Transaction velocity
- Confirmed synthetic fraud label

Workshop rule

- Use fictional, public, redacted or approved data only.
- Name a human reviewer before testing.
- Agree the expected output and pass criteria.

A. Build the Prototype with ChatGPT

- 1 Use synthetic data only:** Never upload real wallet numbers, PINs, identity documents or live transaction details.
- 2 Define suspicious patterns:** Examples: recent SIM swap, new device, many new recipients, unusual time and velocity.
- 3 Ask for feature engineering:** Create transparent indicators from the fictional file.
- 4 Build a risk-ranking demonstration:** Request Low, Medium and High risk with reason codes.
- 5 Measure errors:** Compare results with the synthetic fraud label and calculate false positives.
- 6 Design proportionate responses:** Recommend verification or investigation, not automatic account freezing.

Copy-and-Paste Prompt

Analyse only this synthetic Mpamba transaction dataset. Create transparent anomaly indicators, assign a risk level, provide reason codes, and recommend a proportionate next step. Do not freeze accounts or treat unusual activity as confirmed fraud.

B. Build the Prototype with Microsoft Copilot

- 1 Open the synthetic workbook:** Use Copilot in Excel to create indicators and summaries.
- 2 Build a risk dashboard:** Show score, reason, amount and review status.
- 3 Use Copilot Chat for case summaries:** Generate concise investigator notes from fictional rows.
- 4 Create an internal guidance agent:** Ground it in fraud procedures, not live customer data.
- 5 Test fairness scenarios:** Include rural travel, shared devices and legitimate high-velocity cases.

6

Document human review: Record who can verify, restrict or release an account.

Test, Limits and Deliverable

Minimum validation • False-positive rate • Reason codes understandable • Proportionate action • Appeal/human review • No real customer data	Expected deliverable • A synthetic fraud-risk table, investigator summary, controls checklist and error analysis.
---	---

Important limitation: Neither ChatGPT nor general Microsoft Copilot should be connected directly to live Mpamba transactions for production scoring. A real system requires secure fraud infrastructure, identity controls, auditability, low-latency processing, specialist model validation and regulatory governance.

Revenue Assurance and Reconciliation AI

Business area: Finance

FULL WORKSHOP PROTOTYPE

Pain point	Small mismatches across billing, Mpamba, promotions, partners and the ledger may combine into material revenue leakage.
Prototype outcome	A file-based reconciliation that matches records, finds exceptions, groups root causes and estimates exposure.
Workflow sketch	Billing + payment + partner files -> standardise keys -> match -> exceptions -> root-cause groups -> analyst review.

Before You Begin

Prepare these inputs

- Synthetic billing file
- Synthetic Mpamba/payment file
- Partner settlement file
- Approved tariffs/promotions
- Reconciliation key

Workshop rule

- Use fictional, public, redacted or approved data only.
- Name a human reviewer before testing.
- Agree the expected output and pass criteria.

A. Build the Prototype with ChatGPT

- 1 Upload the files:** Explain the meaning of each key and amount field.
- 2 Check structure:** Ask ChatGPT to identify duplicates, missing keys, inconsistent dates and currency formats.
- 3 Define matching rules:** Start with exact match, then document controlled tolerance rules.
- 4 Run reconciliation:** Create Matched, Missing, Duplicate and Amount Difference groups.
- 5 Estimate exposure:** Sum differences by product, partner, promotion and suspected root cause.
- 6 Export an exception pack:** Download the exception table and a management summary.

Copy-and-Paste Prompt

Reconcile these synthetic TNM billing, Mpamba/payment and partner files. First report data-quality issues. Then apply the stated matching rules and produce: Matched records; Missing records; Duplicates; Amount differences; Estimated exposure; Likely root-cause group. Do not post or recommend automatic ledger entries.

B. Build the Prototype with Microsoft Copilot

- 1 Load files into Excel:** Use Power Query or tables where available to keep a repeatable structure.
- 2 Ask Copilot for matching formulas:** Create lookup, duplicate and variance columns.
- 3 Build an exceptions sheet:** Filter mismatches and rank by estimated exposure.
- 4 Generate a dashboard:** Show matched rate, exposure, top root causes and ageing.
- 5 Use Copilot Chat for narrative:** Draft a finance note that refers to the approved workbook.

Test, Limits and Deliverable

Minimum validation • Matching rule documented • Sample exceptions checked manually • Exposure traceable to rows • No auto-posting • Segregation of duties	Expected deliverable • A reconciliation workbook, exceptions file, leakage dashboard and management summary.
--	---

Important limitation: The workshop can complete an end-to-end file-based prototype. Production needs secure data pipelines, system-of-record controls, scheduled ingestion, role-based access and audit-approved adjustment workflows.

Mpamba Agent-Liquidity Forecasting

Business area: Mobile Money Operations

PARTIAL PROOF OF CONCEPT

Pain point	Agents may run out of cash or electronic float when customers need cash-in or cash-out services.
Prototype outcome	A demonstration that forecasts agent-level liquidity demand and recommends a rebalancing priority.
Workflow sketch	Agent history + paydays + location -> demand forecast -> shortage/excess estimate -> rebalancing recommendation -> manager approval.

Before You Begin

Prepare these inputs

- Synthetic agent transactions
- Opening cash/float
- Payday/market-day calendar
- Location and travel time
- Rebalancing history

Workshop rule

- Use fictional, public, redacted or approved data only.
- Name a human reviewer before testing.
- Agree the expected output and pass criteria.

A. Build the Prototype with ChatGPT

- 1 Upload the agent dataset:** Use one row per agent-day with cash-in, cash-out, opening and closing balance.
- 2 Check seasonality:** Identify weekday, payday, market-day and month-end patterns.
- 3 Forecast demand:** Estimate next-day cash-out and float needs with an uncertainty range.
- 4 Calculate shortage risk:** Compare forecast demand with available balance.
- 5 Rank agents:** Prioritise by customer impact, distance and shortage severity.
- 6 Discuss social value:** Test whether rural agents are unfairly deprioritised by a profit-only rule.

Copy-and-Paste Prompt

Using this synthetic Mpamba agent dataset, identify demand patterns, forecast next-day cash-out and float requirements, estimate shortage/excess, and rank rebalancing priorities. Include uncertainty and ensure rural service access is considered alongside cost.

B. Build the Prototype with Microsoft Copilot

- 1 Use Excel for forecast inputs:** Create day, month-end and event indicators.
- 2 Build shortage/excess columns:** Ask Copilot to calculate forecast gap and risk status.
- 3 Create a map-ready list:** Output agent, district, risk, amount and travel time.
- 4 Use Copilot Chat for daily briefing:** Draft a short rebalancing plan from the workbook.
- 5 Require manager approval:** No automatic movement of funds.
- 6 Compare forecast to actual:** Record missed shortages and unnecessary rebalancing.

Test, Limits and Deliverable

Minimum validation	Expected deliverable
• Shortages predicted • Forecast error measured • Rural-access factor • No customer-level exposure • Human approval	• A liquidity-risk table, rebalancing plan, forecast-accuracy sheet and inclusion check.

Important limitation: ChatGPT/Copilot can demonstrate spreadsheet forecasting and prioritisation. Production needs near-real-time balances, secure operations integration, route optimisation, exception handling and controls over any funds movement.

Energy and Site-Cost Optimisation AI

Business area: Operations and Cost

FULL WORKSHOP PROTOTYPE

Pain point	Fuel, electricity, downtime and maintenance costs must be understood alongside traffic and service value.
Prototype outcome	A dashboard that compares site cost, energy intensity, uptime, traffic and profitability, then identifies improvement opportunities.
Workflow sketch	Energy + fuel + traffic + downtime + revenue -> calculate KPIs -> compare sites -> identify drivers -> draft actions.

Before You Begin

Prepare these inputs

- Synthetic site-cost file
- Fuel/electricity use
- Traffic and revenue
- Downtime
- Maintenance visits
- Site type/region

Workshop rule

- Use fictional, public, redacted or approved data only.
- Name a human reviewer before testing.
- Agree the expected output and pass criteria.

A. Build the Prototype with ChatGPT

- 1 Upload the workbook:** Confirm units for litres, kWh, MWK, traffic and downtime.
- 2 Create KPIs:** Cost per GB, energy per GB, cost per uptime hour, revenue-to-cost ratio.
- 3 Find outliers:** Identify sites with unusually high cost or low utilisation.
- 4 Separate causes:** Ask whether high cost is linked to power, fuel, low traffic or repeated maintenance.
- 5 Build charts:** Create regional and site-level comparisons.
- 6 Draft an action plan:** Prioritise investigation, energy alternatives or configuration review; label assumptions.

Copy-and-Paste Prompt

Analyse this synthetic TNM site-cost workbook. Check units and data quality; calculate cost per GB, energy per GB, uptime, revenue-to-cost ratio and maintenance intensity; identify outliers; explain likely drivers; and propose investigation priorities. Do not recommend shutting a site based only on profitability.

B. Build the Prototype with Microsoft Copilot

- 1 Use Copilot in Excel:** Create KPI columns and conditional formatting.
- 2 Build a dashboard:** Add slicers/filters if available and charts for cost, uptime and revenue.
- 3 Ask for insights:** Request the five strongest cost drivers and supporting cells.
- 4 Create scenarios:** Compare a 10% fuel reduction or improved uptime assumption.
- 5 Use Copilot Chat for narrative:** Draft a one-page operations note grounded in the workbook.

Test, Limits and Deliverable

Minimum validation • Unit consistency • KPI formula checked • Outliers verified • Service/social value considered • Scenario assumptions visible	Expected deliverable • A cost-optimisation dashboard, site-priority table, scenario analysis and management note.
---	--

Important limitation: The workshop can complete the analysis and dashboard. Production optimisation requires validated cost feeds, engineering constraints, investment models and approval for any network or energy change.

Legal and Regulatory Obligation Tracker

Business area: Legal and Compliance

FULL WORKSHOP PROTOTYPE

Pain point	Obligations, deadlines, owners and evidence may be spread across regulations, licences, contracts and correspondence.
Prototype outcome	A source-grounded obligation register extracted from approved documents, with owner, deadline, action and citation.
Workflow sketch	Approved document -> extract obligation -> verify source -> assign owner/deadline -> tracker -> legal review.

Before You Begin

Prepare these inputs

- Public or approved sample regulations
- Fictionalised contract clauses
- Obligation categories
- Owner list
- Tracker template

Workshop rule

- Use fictional, public, redacted or approved data only.
- Name a human reviewer before testing.
- Agree the expected output and pass criteria.

A. Build the Prototype with ChatGPT

- 1 Create a safe document pack:** Use public regulations or approved, redacted training extracts.
- 2 Upload documents:** Ask ChatGPT to list document title, version and effective date first.
- 3 Extract obligations:** Require exact source location, responsible party, deadline and consequence.
- 4 Create the register:** Export to a table with Status, Owner and Evidence columns.
- 5 Check conflicts:** Ask the model to flag—not resolve—apparently inconsistent clauses.
- 6 Legal review:** A qualified TNM legal/compliance person verifies every entry.

Copy-and-Paste Prompt

Using only the uploaded approved documents, extract each legal or regulatory obligation. Return: Obligation; Responsible Party; Deadline/Frequency; Required Evidence; Consequence if stated; Exact Source (document, page/section); Confidence. Do not provide a legal conclusion where the source is unclear; flag for legal review.

B. Build the Prototype with Microsoft Copilot

- 1 Store documents in SharePoint:** Use controlled permissions and current versions.
- 2 Use Copilot Chat for extraction:** Ask for obligations with citations to the attached files.
- 3 Create an Agent Builder agent:** Add only approved legal and regulatory knowledge sources.
- 4 Create an Excel/SharePoint tracker:** Record obligation, owner, deadline, status and evidence.
- 5 Use Copilot Studio for reminders only after approval:** Build controlled notifications, not autonomous legal decisions.

Test, Limits and Deliverable

Minimum validation • Every item has source • Current version used • No fabricated clause • Conflict flagged • Legal approval	Expected deliverable • An obligation register, source index, conflict list and review workflow.
--	---

Important limitation: The workshop can create a complete tracker prototype. The AI does not replace legal advice, determine final interpretation, sign contracts or submit regulatory responses.

HR Skills and Performance AI

Business area: Human Resources

FULL WORKSHOP PROTOTYPE

Pain point	Skills, evidence, scorecards and development needs may be difficult to compare consistently across roles.
Prototype outcome	A transparent assistant that maps verified skills to role requirements and drafts evidence-based development or performance summaries.
Workflow sketch	Role profile + verified employee evidence -> skills match/gaps -> draft review -> manager and employee discussion.

Before You Begin

Prepare these inputs

- Fictional role profiles
- Fictional employee skills/CVs
- Approved KPI definitions
- Evidence notes
- Development options

Workshop rule

- Use fictional, public, redacted or approved data only.
- Name a human reviewer before testing.
- Agree the expected output and pass criteria.

A. Build the Prototype with ChatGPT

- 1 Use fictional or consented data:** Do not upload sensitive employee records for the workshop.
- 2 Define the role criteria:** List required and desirable skills plus evidence standards.
- 3 Upload profiles:** Ask ChatGPT to separate verified evidence from unsupported claims.
- 4 Create a gap table:** Match skills, identify gaps and suggest learning options.
- 5 Draft a balanced summary:** Include achievements, evidence, development areas and questions for discussion.
- 6 Review for bias:** Check whether language or scoring unfairly changes across comparable profiles.

Copy-and-Paste Prompt

Compare the fictional employee profile with the approved role profile. Return: Verified matches; Evidence; Gaps; Development suggestions; Questions for manager discussion. Do not infer age, health, ethnicity, religion, family status or other sensitive traits. Do not make a final hiring, promotion or disciplinary decision.

B. Build the Prototype with Microsoft Copilot

- 1 Store approved templates:** Use SharePoint/OneDrive with HR permissions.
- 2 Use Copilot in Word/Excel:** Compare role requirements with a fictional skills matrix.
- 3 Create an internal agent:** Ground it in role profiles, learning catalogue and review guide.
- 4 Generate draft scorecards:** Keep manager judgement and employee discussion mandatory.
- 5 Test comparable cases:** Use similar profiles with changed names or demographics and compare outputs.
- 6 Record corrections:** Allow employees/managers to correct inaccurate skills evidence.

Test, Limits and Deliverable

Minimum validation • Evidence traceable • No sensitive inference • Comparable cases treated consistently • Human decision retained • Employee can correct data	Expected deliverable • A skills matrix, development plan, review draft and fairness-testing checklist.
---	---

Important limitation: The workshop can complete skills mapping and draft reviews. Production HR use requires privacy, employment-law review, bias testing, access controls, appeal/correction processes and clear limits on automated decision-making.

Evidence-Grounded Board Reporting Copilot

Business area: Board and Strategy Reporting

FULL WORKSHOP PROTOTYPE

Pain point	Board packs can be slow to prepare, inconsistent across teams, and difficult to trace back to approved evidence.
Prototype outcome	A copilot that reads approved KPI tables and reports, drafts concise variance narratives, and links every claim to evidence.
Workflow sketch	Approved reports -> KPI consistency check -> draft narrative -> evidence links -> management sign-off -> Board pack.

Before You Begin

Prepare these inputs

- Synthetic TNM dashboard/workbook
- Approved KPI definitions
- Risk summary
- Management commentary template
- Previous decisions

Workshop rule

- Use fictional, public, redacted or approved data only.
- Name a human reviewer before testing.
- Agree the expected output and pass criteria.

A. Build the Prototype with ChatGPT

- 1 Upload the approved pack:** Use the synthetic TNM dataset/dashboard and a board-note template.
- 2 Check definitions first:** Ask ChatGPT to list period, units, KPI definitions and apparent conflicts.
- 3 Draft the executive summary:** Require numbers, direction of change, likely drivers and evidence location.
- 4 Create decision questions:** Ask for issues requiring Board attention, not unsupported recommendations.
- 5 Verify every statement:** Cross-check figures against the source table.
- 6 Export a draft:** Prepare a concise note for management review and sign-off.

Copy-and-Paste Prompt

Using only the approved TNM training workbook and reports, draft a one-page Board summary. For each material statement include the KPI, period, value, direction of change, likely driver, and exact source table/sheet. Flag conflicting or missing data. Do not invent achievements or remove uncertainty.

B. Build the Prototype with Microsoft Copilot

- 1 Use governed Microsoft 365 files:** Keep final tables and reports in controlled SharePoint locations.
- 2 Use Copilot in Word/PowerPoint:** Draft a narrative from linked approved material.
- 3 Use Copilot Chat for cross-file summary:** Ask it to cite which document supports each point.
- 4 Create a reporting agent:** Use Agent Builder with approved reporting sources only.
- 5 Flag conflicts:** Require the agent to show unresolved differences rather than selecting one silently.

Test, Limits and Deliverable

Minimum validation • All numbers verified • Source shown • KPI definitions consistent • Conflicts visible • Management sign-off	Expected deliverable • A one-page Board summary, evidence map, unresolved-issues list and sign-off checklist.
--	--

Important limitation: The workshop can produce a complete evidence-grounded draft. The AI cannot approve disclosures, certify financial information, replace directors' judgement or access unapproved confidential sources.

Enterprise Risk-Sensing AI

Business area: Governance and Enterprise Risk

PARTIAL PROOF OF CONCEPT

Pain point	Risk signals are spread across finance, network, Mpamba, legal, procurement, cyber and customer operations.
Prototype outcome	A demonstration that combines a synthetic risk register and key indicators to identify emerging patterns and draft an early-warning brief.
Workflow sketch	Risk register + KRIs + incidents -> trend/anomaly analysis -> linked-risk narrative -> owner review -> escalation.

Before You Begin

Prepare these inputs

- Synthetic risk register
- Key risk indicators
- Control ratings
- Incident log
- Risk appetite thresholds
- Owners and due dates

Workshop rule

- Use fictional, public, redacted or approved data only.
- Name a human reviewer before testing.
- Agree the expected output and pass criteria.

A. Build the Prototype with ChatGPT

- 1 Upload the risk files:** Explain the rating scale and approved risk appetite.
- 2 Check completeness:** Find missing owners, overdue actions and inconsistent scoring.
- 3 Analyse indicators:** Identify deteriorating trends and threshold breaches.
- 4 Connect related signals:** Ask for evidence-based links, such as forex delays + fuel cost + equipment lead time.
- 5 Draft an early-warning note:** Include evidence, uncertainty, owner and proposed discussion question.
- 6 Keep decisions human:** Risk acceptance, closure and escalation remain with management and the Board.

Copy-and-Paste Prompt

Analyse this synthetic TNM risk register and KRI file. Identify overdue actions, threshold breaches, deteriorating trends and plausible linked risks. For each alert provide evidence, uncertainty, owner and the governance forum that should review it. Do not accept, close or downgrade a risk.

B. Build the Prototype with Microsoft Copilot

- 1 Use Excel/SharePoint risk data:** Create views for owner, status, threshold and overdue actions.
- 2 Use Copilot for trend summaries:** Request the strongest changes and supporting rows.
- 3 Build a risk knowledge agent:** Ground it in risk policy, appetite and approved reports.
- 4 Create controlled reminders:** Use Copilot Studio/Power Automate only with approved escalation rules.
- 5 Prepare Committee brief:** Draft a concise narrative with evidence links.

6

Validate regularly: Review missed events, noisy alerts and changes in risk appetite.

Test, Limits and Deliverable

Minimum validation • Thresholds approved • Owner named • Evidence traceable • No automatic risk closure • False/noisy alerts reviewed	Expected deliverable • An early-warning dashboard, risk brief, overdue-action list and governance checklist.
--	---

Important limitation: ChatGPT and Copilot can analyse periodic files and draft an early-warning brief. A production risk-sensing system requires continuous governed feeds, identity/access controls, validated alert logic, risk-owner workflows and Board-approved escalation rules.

Practical Session Planning Matrix

Use this matrix to select co-creation exercise, based on available time, files and your group's interest.

No.	Use Case	Status	Suggested Time	Primary Output
1	Multilingual Customer-Service Copilot	Full	45-60 min	Internal chatbot
2	Complaint Classification and Routing AI	Full	30-45 min	Classified complaints
3	Network Congestion Forecasting AI	Partial	45 min	Forecast chart
4	Predictive Site-Maintenance AI	Partial	45 min	Risk-ranked sites
5	Mpamba Fraud-Anomaly Detection AI	Partial	45 min	Fraud-risk table
6	Revenue Assurance and Reconciliation AI	Full	60-75 min	Reconciliation pack
7	Mpamba Agent-Liquidity Forecasting	Partial	45 min	Liquidity plan
8	Energy and Site-Cost Optimisation AI	Full	60 min	Cost dashboard
9	Legal and Regulatory Obligation Tracker	Full	45-60 min	Obligation register
10	HR Skills and Performance AI	Full	45 min	Skills matrix
11	Evidence-Grounded Board Reporting Copilot	Full	45-60 min	Board brief
12	Enterprise Risk-Sensing AI	Partial	45 min	Risk brief

Closing Principle

Use ChatGPT and Microsoft Copilot to retrieve, classify, analyse, forecast, draft and explain. Keep accountable TNM people responsible for customer impact, money, employment, legal interpretation, network control, risk acceptance and Board decisions.
